

Answers to the questions of Safire team

Q1 find the major Diff between the 2 OCR model compare them in their repose time how much resources they use which is a better choice for PROD.

Ans Chandra (by Datalab):

Document intelligence model designed for basically high accuracy results.

Best for the production where layout matters.

Excellent in maintaining the relationship in complex tables

multilaguage support(over 90) also support handwritten text.

Speed 2 page/sec

DeepSeek-OCR

it is a LLM centric model but this model trades off in accuracy

it is best for training the large scale ai.

Highly optimized with a speed of 2500 tokens/sec i.e 5 page/sec.

Used for feading the data to large language models.

Feature	Chandra	DeepSeek-OCR
Best Use Case	Forms, Tables, Handwriting	Speed, Large Datasets, General Images
Hindi Support	Very Strong (90+ languages)	Good (General Multilingual)
Speed	High (2 pages/sec on H100)	Extremely High (2500 tokens/sec)

Chocie for production completely depends on your need if you want accuracy,g **invoices, technical manuals, or textbooks** where losing a single table cell or formula would break your downstream AI logic then go with chandra but i u want speed and accuracy does not matters like user uploads a photo and u need response under a second user deepseek-OCR.

Chandra is more costly and has more memory requirements as compared to the deepseek OCR.

Q2 The test OpenDataLoader PDF is is worth our time with that check the PageIndex How to work with it if we want to do a system with document indexing?

Ans opendataloader, chandra and deepseek these all work together OpenDataLoader as the project Manager while Deepseek-OCR and Chandra as Specialist Workers.

What open dataloader does it took the pdf and handles the complex readings breaking the page into sections and then called the ocr model for futhur work.

Two stack designed for work:

1. Accuracy stack:

framework : opendataloader

Engine : Chandra 2

result: You get the safety/citation features of the tool combined with the best-in-class table and structure accuracy of Chandra.

2. Velocity stack:

Framework : OpenDataLoader

Enginee: DeepSeek-OCR

result : You process pages 2-3x faster. You might lose some table formatting, but you'll index millions of documents at a fraction of the cost.

PageIndex is a repository for building Vectorless RAG designed to solve major problem in traditional ai called chunking and then finding the similarity but fails for long and complex documents.

Page Index creates a semantic tree and convert a 100 page pdf into hierarchical table of contents where every node has a summnary used in RAG for higher accuracy (98.7%) Because it navigates a tree, it can tell you exactly *why* it chose a specific section, providing a clear "reasoning path" with page and section references.

Inegrating the opendataloader and pageIndex is highly effective for the production grade especially if your goal is high-accuracy retrievl for complex technical or professional documents.

How the openDataLoader and PageIndex work together Work together?

Extraction OpenDataLoader Converts the raw PDF into clean, structured **Markdown** or **JSON**. It handles the "Garbage In" problem by preserving tables and reading order.

Indexing PageIndex Takes that clean text and builds a **Semantic Tree** (a "Smart Table of Contents"). It summarizes every section so the AI knows "what is where" without reading every word.

Retrieval Reasoning LLM When a user asks a question, the AI "walks" the tree to find the exact section, then zooms in to extract the answer.

Q3Link Portal is tool worth looking Check that is it actually help use to save money on tokens.

Ans Yes it can absolutely save you money on tokens

1. Eliminating "Context Bloat":

The Open Session tools (like **KARIMO** and **OpenClaw**) use "smart routing" to only show the AI the specific tools it needs for the current task, which can save **10–15 KB of tokens per turn**.

2. Structured Plan Mode:

A cheap model handle routine formatting and planning expensive reasoning model is called for heavy lifting if there is not need it will be not called which automatically saves tokens.
